

## Workspace Instructions

Before you start on your first exercise, please note the following instruction.

1. After you have updated the DAG, you will need to run `/opt/airflow/start.sh` command to start the Airflow webserver. See the screenshot below for the Exercise 1 Workspace.

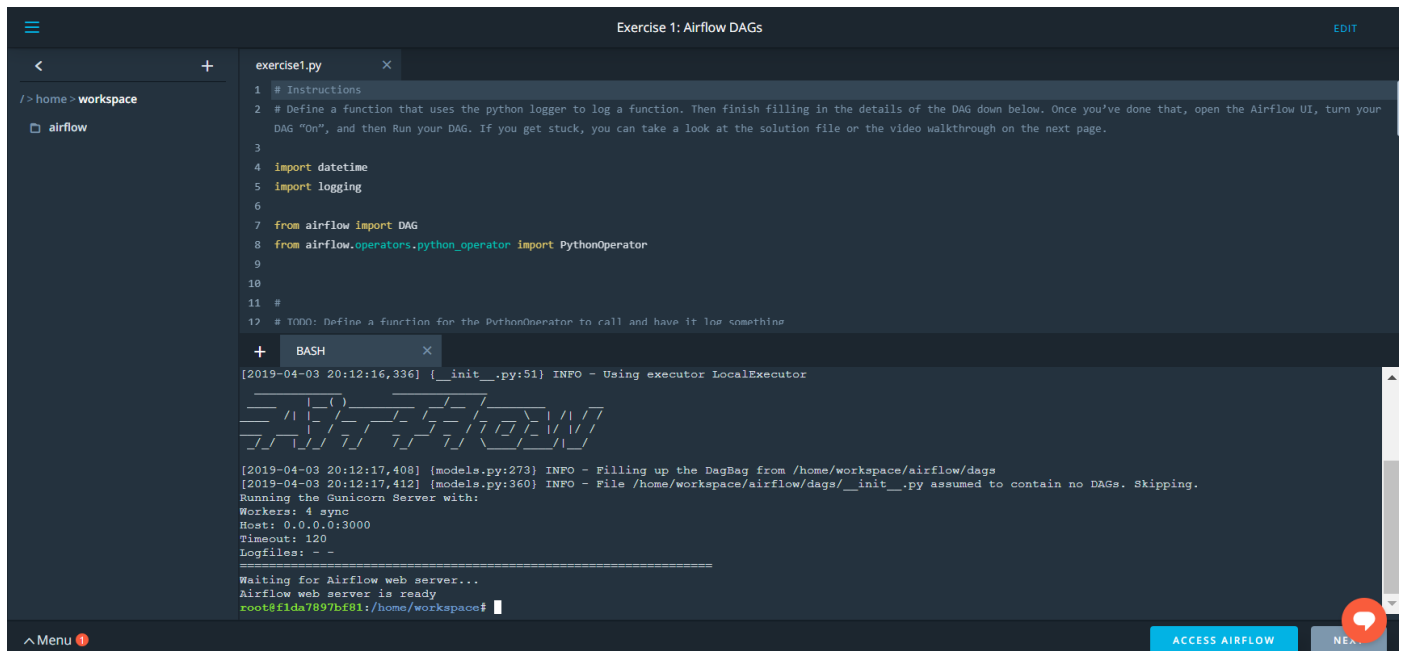

The screenshot shows the 'Exercise 1: Airflow DAGs' workspace. On the left, there's a sidebar with a file explorer showing 'workspace' and 'airflow'. The main area displays the 'exercise1.py' file with the following content:

```
1 # Instructions
2 # Define a function that uses the python logger to log a function. Then finish filling in the details of the DAG down below. Once you've done that, run "/opt/airflow/start.sh"
  command to start the web server. Once the Airflow web server is ready, open the Airflow UI using the "Access Airflow" button. Turn your DAG "On", and then Run your DAG. If you get
  stuck, you can take a look at the solution file or the video walkthrough on the next page.
3
4 import datetime
5 import logging
6
7 from airflow import DAG
8 from airflow.operators.python_operator import PythonOperator
9
10
11 #
```

Below the file editor is a terminal window titled 'BASH' showing the command `root@9037fb74e230:/home/workspace# /opt/airflow/start.sh` being executed.

At the bottom right, there are two buttons: 'ACCESS AIRFLOW' (blue) and 'NEXT' (grey).

2. Wait for the Airflow web server to be ready (see screenshot below).

The screenshot shows the 'Exercise 1: Airflow DAGs' workspace. The 'exercise1.py' file is open, showing the same content as the previous screenshot, but with an additional line at the bottom:

```
12 # TODO: Define a function for the PythonOperator to call and have it log something
```

The terminal window shows the output of the `/opt/airflow/start.sh` command, including logs from the Airflow web server and the Gunicorn server. The logs indicate that the web server is ready and the Gunicorn server is running.

At the bottom right, there are two buttons: 'ACCESS AIRFLOW' (blue) and 'NEXT' (grey).

3. Access the Airflow UI by clicking on the blue "Access Airflow" button.

This should be able to access the Airflow UI without any delay.

**Please note:** Because the files located in the s3 bucket 'udacity-dend' are very large, Airflow can take up to 10 minutes to make the connection.
